

Interview snapshot - Campus departure interview 1

- Interviewer: Oleh Goumain
- Notetaker: Jiawen Li
- Interview ended: 09/29/2026, 3:52 pm, EDT
- Snapshot completed: 09/29/2026, 4:26 pm, EDT
- **Who:** Sophomore, walks between several buildings daily with tight turnarounds
- **Problem confirmed?** Yes, mildly. Described before the concept: last Tuesday he left a lab on time, waited for a slow elevator, arrived about four minutes late, and missed an attendance quiz. The cause is uncertain travel time, not inability to leave the previous class.
- **Key quote:** "Guessing how long it'll take."
- **Emotional intensity (1–10):** 3. He spoke quickly and gestured about the elevator, but described the consequence as minor.
- **Current solution:** Leaves immediately and walks fast; sometimes uses Google Maps for unfamiliar buildings. Works for familiar buildings only.
- **Money spent?:** None.
- **Solution reaction:** "Huh. Okay, that could be useful for new buildings." Said he wouldn't use it for familiar ones.
- **Biggest concern:** "Another notification," plus constant location access.
- **Referral?:** Offered to introduce Dana, a first-year who gets lost often.
- **Follow-up?:** Agreed.
- **Surprise:** Value is concentrated in unfamiliar buildings, so new students may be the better target than experienced ones. Elevator waits, which indoor mapping apps ignore, were a main source of delay. A prior transit app failed indoors.
- **Signal (green/yellow/red):** Yellow. Real, repeated incident with a minor cost, a failed prior workaround, and an actual referral and follow-up. Against that: no spend, low intensity, tepid reaction for familiar routes, and notification and location-privacy concerns.
