

UnlockDrill

Research, brand position, visual direction, and coding-agent setup

One question. A smaller start.

An opt-in shortcut that offers one short SAT practice question when a student opens an app they chose. The product aims to make starting practice easier during moments that might otherwise become unplanned scrolling.

What this report contains

A synthesis of 12 supplied interview accounts; a focused public Reddit scan; three evidence-based persona prompts and simulated critiques; a proposed brand position; visual and logo explorations; and a draft development setup.

Evidence and authorship

Prepared with AI assistance from the team's supplied notes and public sources. Research findings, design proposals, and simulations are labeled separately. Interview participants are referenced by IDs; persona names are aliases. Team roster was not supplied.

Submission status

This is a consolidated working report, not a claim that every required activity is finished. The team's independent Part A synthesis, manual Reddit corpus, team design feedback, installed persona tests, and product-repo setup still need completion or confirmation. The assignment requests a pull request with files, rather than a PDF alone.

The evidence base

Source: user-supplied raw notes and snapshots. IDs below remain consistent throughout the report.

ID / interview	Main signal and relationship to UnlockDrill
I01 / tutored student	Finding and organizing material; tutor took a week to book. Adjacent tutoring problem. About \$2,000 in prep spending.
I02 / friend of friend	Time, focus, and embarrassment asking for help. Free teacher support worked.
I03 / Mira	Starting SAT prep feels difficult; phone scrolling absorbs time. Direct problem evidence.
I04 / Laya	Dismisses Screen Time; skeptical after other blockers failed. Direct counter-signal.
I05 / Darsh	Reads the answer, then repeats mistakes; open to one-tap tagging. ErrorJournal evidence.
I06 / Arya	Abandoned a mistake notebook; cannot reliably diagnose mistakes. ErrorJournal counter-signal.
I07 / Alicia	Tired after homework; video scrolling replaces prep. Conditional interest in one question, with skip and frequency controls.
I08 / Sam	Scattered review notes and answer memorization; wants similar questions. ErrorJournal evidence.
I09 / Participant A	Weekend study, repeated algebra errors, ineffective categorization. Adjacent review problem.
I10 / Participant B	Phone interruptions, broken schedules, useful short gaps. Retrospective account; product pitch and leading questions.
I11 / cousin	Study time and concept help; AI limits and reported incorrect answers. Adjacent tutoring problem.
I12 / family friend	Free group program lacks time for individual help. Adjacent tutoring problem.

Scope: 12 interview accounts, not 12 validated customers. Some notes are summaries rather than transcripts. Ages are largely unreported. Dates are mixed or missing; do not assign October 2 to every account.

What the team had observed

Editorial reconstruction of supplied snapshots. This is not an independently written, pre-AI synthesis.

Existing human interpretation

The supplied snapshots distinguish several problems. Mira's takeaway identifies starting as the barrier rather than material. Laya's notes emphasize bypassing limits and skepticism about another blocker. Alicia's snapshot confirms difficulty starting and phone distraction, but explicitly leaves the effectiveness of pre-app questions untested.

The SAT tutoring snapshots describe access, organization, confidence, and feedback. I01 names finding and organizing materials before delayed tutor review. I02 identifies time and focus first; embarrassment matters when asking for help. These findings should not be rewritten as proof that everyone wants UnlockDrill.

The ErrorJournal snapshots describe a separate difficulty: reading the right answer does not establish understanding. I05, I08, I09, and I10 describe recurring mistakes; I06 questions whether students can accurately explain their own errors. These observations may inform future question selection but do not justify adding a full error journal to the first version.

Contradictions already present in the notes

Laya's failed limits suggest a need for stronger interruption, while Alicia would turn off an app that interrupts too often or prevents a necessary skip. Short practice feels manageable to Alicia and Participant B, but this does not establish that a single question produces durable learning.

Surprises already recorded

Participant B describes a tutor's value as accountability, not just explanations. I01 prioritizes finding material over reviewing wrong answers. I02's barrier to help is embarrassment. These are distinct surprises with different design implications.

Required team addition

The original independent synthesis was not provided. Before submitting, the team should insert its own pre-AI write-up, including its own five selected quotations and overall interpretation. The exact-quote set on page 5 belongs to the AI synthesis; it should not be relabeled as the team's original work.

AI thematic synthesis

All 12 accounts were considered before naming themes. Strength describes evidence quality and specificity, not a population estimate.

Theme	Evidence, strength, and implication
Starting competes with fatigue and real schedules	I02, I03, I07, I10; I09 and I11 add time constraints. Strongest concrete account: I07's planned study became videos and then sleep. Start with a small action; do not diagnose laziness.
The phone is both the interruption and a possible practice surface	I03, I04, I07, I10. Direct reports of scrolling or ignored limits. Strong problem evidence, weaker solution evidence: only I07 directly reacts to the pre-app question concept.
Control and friction pull in opposite directions	I04 dismisses limits; I07 requires skip and reasonable frequency. I10 would abandon a chore-like app. Treat the acceptable amount of interruption as a testable design choice.
Short opportunities can feel more manageable	I03 is open to an easier start; I07 prefers a couple questions; I10 recalls effective 10-15 minute gaps and asks for a two-minute experience. Preference is not measured learning effectiveness.
Wrong-answer review often stops at recognition	I05, I08, I09, I10 report recurring errors or remembering answers. I06 and I09 cannot reliably classify the cause. Supports future review research, not automatic scope expansion.
Help has several different bottlenecks	I01: booking and organization. I02: embarrassment. I11: AI access and reliability. I12: group teacher capacity. Do not collapse these into one "expensive tutoring" claim.

Emotional weight

I03's lost hours, I07's missed session, and I10's feeling of being behind give concrete stakes. Snapshot intensity scores are not comparable measurements: some are numeric, others say "normal." I10's vivid detail deserves attention but its retrospective and leading format lowers confidence in product enthusiasm.

Quotes, tensions, and segments

Five telling quotations copied from the supplied raw notes; no snapshot-only quotation is presented as transcript evidence.

“The hardest part is just sitting down to start. Once I pick up my phone, hours are gone.”

I03 / Mira, explicitly labeled quote in raw notes.

“Screen Time doesn't do anything for me. I just tap ignore and keep scrolling.”

I04 / Laya, explicitly labeled quote in raw notes.

“But if it popped up every time or wouldn't let me skip when I needed to check something, I'd probably turn it off.”

I07 / Alicia, raw response to the product concept.

“If I knew why I got it wrong, I wouldn't have gotten it wrong.”

I06 / Arya, explicitly labeled quote in raw notes.

“It has to take two minutes. If it takes two minutes and it's a little fun, I'm there. If it's twenty minutes of work I already have homework.”

I10 / Participant B, raw response after a product pitch; conditional interest.

Unresolved contradictions

Keep I04's demand for effective friction separate from I07's demand for autonomy. Keep I05's willingness to tag mistakes separate from I06's objection to self-diagnosis. I02 obtained useful free help; I12's free help was capacity-limited. These may reflect different people and circumstances, not inconsistent data.

Surprises and candidate segments

Accountability can matter more than content (I10). Tracking can exist without insight (I09). Candidate UnlockDrill segments are the tired starter, the blocker skeptic, and the student seeking worthwhile brief review. These are working segments, not measured market sizes.

Overall read: the strongest case is for testing a small, voluntary practice interruption. There is no observed retention, score improvement, willingness to pay, or proof that app-triggered delivery works on the intended devices.

Comparison and quote audit

AI-drafted comparison for team review. It compares supplied snapshots with this synthesis, not an unavailable independent Part A document.

The team's snapshots already identify starting friction, ignored limits, repeated mistakes, and the difference between a confirmed problem and an untested solution. The AI synthesis makes the cross-interview conflict more explicit: a blocker that is easy to dismiss may be ineffective for Laya, while a blocker that cannot be skipped may lose Alicia. It also separates the three original idea spaces. Difficulty obtaining explanations is not the same as difficulty beginning a study session, and repeated mistakes do not by themselves support a pre-app question. That separation leads to a narrower first product: one useful question, transparent controls, and a direct test of whether students keep the intervention enabled.

The supplied human notes preserve context the AI could otherwise flatten: some concerns appeared only after prompting, Participant B heard a pitch and leading questions, and several positive reactions came with conditions. They also record surprises such as tutoring as accountability and embarrassment about seeking free help. The AI adds a wording audit: several snapshot "quotes" are absent from or differ from the raw responses. The team should check the quotations below against original messages or recordings and replace this comparison with its own reflection where it disagrees. Neither the interviews nor this synthesis establish demand at scale.

Audit findings

Account	Raw-note check and handling
I01	Snapshot says "I went to a tutor that took a week to book with to go over a problem set"; raw notes say "Went to a tutor to go over the problem set. The tutor took a week to book." Use raw wording or identify snapshot wording as a summary.
I11	Snapshot quote about waiting hours for Claude usage to reset is not in the supplied raw responses. Exclude it from exact-quote evidence.
I12	Snapshot quote "It's hard to get consistent feedback or help." is not in the supplied raw responses. Use the actual statements about one teacher and running out of time.
I07	Snapshot concern is vague; the raw response specifically names frequency and the ability to skip. Use those specific conditions.
I10	Product was pitched early and several prompts suggested answers. Preserve this limitation when quoting positive reactions.

A focused public scan

Method: web searches and publicly readable threads, accessed October 9, 2026. This is not the required manually saved JSON corpus.

Search scope

Queries combined r/Sat with “scrolling,” “start studying,” and “phone,” plus “screen time,” “ignore limit,” and studying. Five relevant discussions were selected. Product-promotion posts were not used as independent customer validation. No prevalence estimate is drawn from this small, self-selected sample.

Source	Finding and boundary
R1 / r/Sat	The original poster describes checking a phone every two minutes and imagines short questions. The same post worries about attention span. A commenter recommends moving the phone away. Demand for another app is not unanimous.
R2 / r/Sat	One student already interrupts Reddit scrolling to solve posted problems. This is a behavioral analogue for UnlockDrill, not a test of it. A reply describes anxiety about not studying, suggesting a risk in guilt-based copy.
R3 / r/digitalminimalism	The original poster describes bypassing limits, opening a browser, or disabling restrictions. This supports studying escape behavior rather than assuming installation equals continued use.
R4 / r/Sat	A student does not know which math resources to use. That is an adjacent organization problem; do not count it as evidence for app interception.
R5 / r/UPSC	An exam-prep poster describes abandoning or bypassing blockers. Useful cross-context evidence, but UPSC students are not automatically representative of SAT students.

What changes in the product brief

A brief question during scrolling has a recognizable analogue (R2), but micro-format interest coexists with concern about attention (R1). Keep the experience finite: one question and a clear end. Treat bypass and disabling as research outcomes. Preserve room for longer study rather than presenting UnlockDrill as a complete SAT course.

Assignment gap: no class research-agent installation or 30-100 manually saved JSON files is claimed. The linked thread register and quote ledger are a useful research supplement; manual collection remains outstanding.

Customer language with provenance

Exact excerpts from public posts. Each link identifies the original thread; R1-Q2 is a second excerpt from the same author, not another participant.

R1-Q1

“like i sit down to study and somehow end up scrolling on my phone every 2 minutes”

[Open source thread](#) · Original post. Use: brand problem statement; Persona 1.

R1-Q2

“but also i feel like that might just make my attention span worse idk”

[Open source thread](#) · Original post. Use: brand guardrail against endless feeds; Persona 3.

R2-Q1

“I make myself stop and do the problem and read the comments.”

[Open source thread](#) · Original post, exact sentence fragment. Use: brand mechanism; Persona 1 and Persona 3.

R3-Q1

“What usually kills it for me isn’t the block itself — it’s how easy it is to hit Ignore Limit, open Safari, or just turn the whole thing off at 11pm.”

[Open source thread](#) · Original post. Use: brand friction/control tension; Persona 2.

R4-Q1

“I only need to work on math but don’t know what to use to get started.”

[Open source thread](#) · Original post. Use: brand scope boundary; keep resource discovery distinct from distraction.

Thread register

R1: [SAT focus and scrolling](#) · R2: [Solving problems while scrolling](#) · R3: [Soft-mode escape paths](#) · R4: [How to start SAT studying](#) · R5: [Blocker survival during UPSC prep](#)

Five excerpts are selected for internal positioning. They inform language and decisions; they are not testimonials about UnlockDrill. No Reddit writer was contacted or asked to endorse the product.

Three distinct review lenses

Evidence-based composites. Names are aliases; exact ages are unknown and deliberately not invented. Agent installation remains pending.

Persona	Situation, priorities, and refusal conditions
Maya / tired starter	Life stage: SAT-preparing student; exact age unreported. Basis: I03 and I07. After homework, practice feels like another large task; a phone break can consume the evening. Wants an easy first action. Fears turning a necessary app check into more homework. Says no to every-open interruptions and unavailable skip.
Jordan / blocker skeptic	Life stage: student experiencing phone distraction; exact age unreported. Basis: I04. Has dismissed Screen Time and doubts another blocker. Wants a reason this intervention will change behavior. Fears setup effort followed by automatic bypass. Says no to unsupported promises or a feature that feels identical to an ignored limit.
Casey / purposeful reviewer	Life stage: SAT learner or recent test taker; exact age unreported. Basis: I08 and I10. Wants small practice opportunities to address actual weak spots. Fears busywork, memorizing old answers, and long explanations. Says no to random trivia, extensive logging, or claims that tiny drills replace full preparation.

Evidence anchors

Maya: I03's "The hardest part is just sitting down to start." and I07's skip/frequency condition. Reddit: R1-Q1 and R2-Q1. Jordan: I04's "I just tap ignore and keep scrolling." Reddit: R3-Q1. Casey: I08's "Sometimes I just remember the answer, so I don't know if I actually learned it." and I10's two-minute condition. Reddit: R1-Q2 and R2-Q1.

Boundaries

These personas model attitudes supported by the notes. They are not three observed individuals and must not invent household income, exact age, device ownership, willingness to pay, disability, or school details. Maya and Jordan may need different frequency settings; Casey may be a secondary audience rather than a launch priority.

Use personas to challenge copy

The role prompts below are also supplied as editable files. Reviews are AI role simulations, not participant feedback or independent agent runs.

Shared instruction for every persona

Read the brand position, then respond in first person as the specified composite. Use only the cited evidence. Separate evidence from inference. Do not invent biography, purchase intent, or test outcomes. Return: what I think this does; what is unclear; what would make me disable it; one requested change; and the evidence behind the reaction.

Role-specific instruction	Simulated reaction to the initial position
Maya: prioritize the effort to start and the ability to check an app when needed. Anchor to I03/I07 and R1-Q1/R2-Q1.	"One question sounds manageable, but I need to know how often it appears and whether I can skip." Change: describe pause, skip, and chosen timing next to the main promise.
Jordan: challenge whether the intervention survives repeated use. Anchor to I04 and R3-Q1; do not demand coercion on behalf of all users.	"If I can ignore it like every other limit, what makes this worth setting up?" Change: explain the actual action offered; test bypass and continued use rather than promising to stop scrolling.
Casey: challenge educational relevance and task length. Anchor to I08/I10 and R1-Q2/R2-Q1.	"What am I practicing, and will it teach me anything if I just remember an answer?" Change: identify the topic, offer a brief explanation, and reserve similar-question follow-up for testing.

Revision after simulation

Initial: "Turn phone time into SAT practice." Revised: "One SAT question before you scroll. Choose your apps and when prompts appear. Answer a short question, see a brief explanation, or skip when you need to." This is proposed product behavior, not a statement that a working integration already exists.

What still needs testing

Install the prompts in the chosen coding tool, rerun each with the team-approved brand position, and save the outputs. Then test the product with actual students. Persona agreement is not validation, and simulated objections should not be reported as interview quotes.

Make the first step smaller

Proposed internal brand position, grounded in the supplied interviews and the focused Reddit scan; team approval pending.

Brand thesis

Students who intend to practice can lose the moment to fatigue and automatic scrolling. UnlockDrill should make one useful practice action easy to begin at that moment, while respecting the student's control over their phone.

Positioning statement

For SAT students who keep postponing practice and reflexively opening distracting apps, UnlockDrill is an opt-in practice shortcut that offers one short SAT question when they open an app they selected. Its proposed focus is a small, relevant start with transparent controls for skipping, pausing, and frequency.

Target identity and job

Identity: "I want to follow through on studying, even when a full session feels too big." This is brand-written language, not an interview quote.

Job: When I reach for my phone during a break, help me do one useful piece of SAT practice without turning the break into another long assignment.

Promise and reasons to believe

Promise a clear experience: one question, a brief explanation, and a visible end. I03 and I07 support lowering the effort to start; I07 and I10 support keeping the interaction brief and controllable; R2 supplies an existing behavior that resembles inserting a question into scrolling. These support the hypothesis, not a claim of effectiveness.

Personality and voice

Calm, specific, respectful. Talk to the student as someone making choices. Prefer "Try one question" and "Pause prompts" over guilt, parental surveillance, or dramatic transformation. Wrong answers should lead to a useful explanation, not a punishment.

Position boundaries

UnlockDrill is proposed as a supplement to planned study. Do not claim guaranteed score gains, a cure for phone addiction, universal app compatibility, official SAT endorsement, or validated two-minute completion. Do not turn the feature into a requirement to earn ordinary phone access.

A concrete promise, carefully bounded

Customer quotations guide the internal vocabulary. Public copy below is newly written and is not presented as a customer endorsement.

Use internally	Source and implication
"just sitting down to start"	I03. Center the moment of starting, not a claim that students lack motivation.
"Doing a couple questions at a time feels easier"	I07, exact excerpt. Keep the task visibly small.
"I just tap ignore and keep scrolling."	I04, exact excerpt. Test repeat-use behavior; do not equate a reminder with a solution.
"make it not feel like homework"	I10, exact excerpt. Avoid long setup and obligatory explanations.
"I make myself stop and do the problem"	R2, exact excerpt. A question can interrupt a feed; effectiveness remains untested.

Suggested landing-page copy

Headline: One SAT question before you scroll.

Subhead: Choose an app. Try a short practice question at the moments you select. Keep control with skip and pause.

Primary action: Try a sample question.

Supporting line: A small start for the days a full study session feels too big.

A close alternative already exists

[StudyIn](#) advertises SAT/ACT study sessions, quizzes, and app access earned by passing. UnlockDrill's proposed emphasis is a single brief question with user-controlled interruption. This is a positioning hypothesis, not proof of a unique capability or superiority. Do not call the idea first-of-its-kind.

MVP boundary

Prototype app selection, one reviewed question, brief answer feedback, skip, pause, and a frequency control. Validate the phone integration separately before promising it. Defer a full error journal, AI tutor, social leaderboard, audio narration, and a complete adaptive curriculum. Start by testing whether students keep using the small interaction.

Five directions to react to

Round 1 concepts, not completed team feedback. Matching HTML samples are included in the supporting files.

One question before you scroll.

Try a sample question

A / Calm momentum

Warm paper, forest green, generous spacing. Proposed lead: calm enough for a tired student.

One question before you scroll.

Try a sample question

B / Study notebook

Editorial serif and ruled-paper mood. More academic; may feel like extra homework.

One question before you scroll.

Try a sample question

C / Quick spark

Violet, compact cards, lively emphasis. Faster energy; keep celebration restrained.

One question before you scroll.

Try a sample question

D / Quiet night

Dark surface and soft mint. Low-glare mood; validate daytime readability.

One question before you scroll.

Try a sample question

E / Clear utility

Monochrome and dense clarity. Very direct; may feel impersonal.

Reference-review shortlist

[Duolingo](#) for approachable learning; [Khan Academy](#) for educational clarity; [Forest](#) for a calm focus metaphor. These are suggested references, not team-selected preferences or a completed visual audit.

Calm momentum

Direction A is an AI recommendation for review. Team keep/kill notes and phone testing are still required.

				
Paper #F7F6F0	Ink #182E29	Forest #21664C	Mint #DDEEE4	Accent #EFCB74

Element	Rule
Typography	Arial for the supplied prototype; system sans-serif fallback. H1 40-48 px desktop / 32 px mobile; body 16-18 px; line height 1.5. Bold for actions, regular for explanations.
Layout	One primary action per screen. 8 px spacing unit; 24 px card padding; 16 px mobile margins. Content width capped at 1,080 px. No endless feed.
Controls	44 px minimum proposed target height. Text labels for Answer, Skip, and Pause. Show selected, focus, disabled, and error states with more than color alone.
Color	Ink on paper for reading. White text on forest-green primary controls. Mint for supporting panels. Gold is decorative, not a text color on white. Verify all final combinations.
Feedback	Use "Correct" or "Try this explanation," with a brief reason. Do not shame a wrong answer. Always show how to leave the question.
Motion and imagery	Small state transitions, no required animation. Respect reduced-motion settings. Prefer the real question interface over stock photos or unearned score celebrations.

Example question card

Algebra · one practice question

If $3x + 4 = 19$, what is x ?

A 3 B 5 C 7 D 9

Feedback: $x = 5$. Subtract 4 from both sides, then divide by 3.

Actions: Check answer · Skip for now · Pause prompts

Original sample question, created for this report. It is not an official SAT item. Style values are specifications for a prototype, not a completed accessibility certification.

Twelve rough marks

Round 1: distinct vector ideas. These are candidates for discussion, not a record of team selection.

01 Open U + arrow

02 Question tile

03 Pause + play

04 Open doorway

05 U monogram

06 Spark + dot

07 Step upward

08 Open book

09 Check tile

10 Question orbit

11 UD monogram

12 One-question badge

Proposed lead: 01, the open U with an upward arrow. It connects the product name to a small action without implying a mandatory padlock. Keep the silhouette simple. Ask the team which marks feel helpful, punitive, childish, or generic before choosing a final direction.

A usable provisional mark

The open U + arrow is provided in SVG and PNG variants. This direction remains subject to team review.

Rule	Specification
Meaning	An open U and a forward/upward gesture: a small step, not a locked gate.
Lockup	Align the visible mark height to the wordmark's capital height. Use a gap of roughly half that height. The wordmark uses Arial Bold in these draft assets.
Clear space	Reserve at least one quarter of the mark height on all sides. Do not place copy inside the open U.
Color variants	Forest on light; white on dark; black and white one-color versions. Do not add shadows, gradients, outlines, or rotate the mark.
Size	Use the simplified square mark for small icons. Supplied raster sizes: 16, 32, 48, 180, 192, and 512 px. Treat 16 px as the candidate minimum and confirm on actual devices.
Files supplied	Mark, square icon, horizontal lockups, stacked layout, social avatar, light/dark and black/white variants, plus favicon PNGs and ICO.

Small-size check

16 px equivalent

32 px equivalent

48 px equivalent

Vector artwork is original to this report. No trademark availability search has been performed.

Specify the behavior before building

Framework recommendation and draft repo contract. No product repository or framework installation is claimed.

Selected framework: OpenSpec

OpenSpec is a spec-driven framework for AI coding assistants. Its documented workflow records a proposal, requirements, design, and implementation tasks before changes are applied. We recommend it because UnlockDrill's hardest early questions are behavioral: when to prompt, how to skip, and how to avoid repeated interruptions. [Official repository](#).

First feature brief

Feature: one-question practice interruption.

Goal: help a consenting student begin a small practice action.

Not yet solved: platform support for the app-open trigger; permissions; a safe return path; frequency behavior across app launches.

Prototype first: simulate an app-open event and test the question flow without claiming device-level interception.

Acceptance scenario	Expected behavior
First eligible opening	Show exactly one question for the chosen topic, with a visible skip action.
Correct or incorrect response	Give a short explanation. Never require a correct answer to regain ordinary access in the proposed default mode.
Skip or pause	Exit clearly; respect pause and frequency preferences. No repeated prompt loop on return.
Trigger unavailable or offline	Explain what is unavailable and provide a safe exit. Do not trap the user behind a loading screen.
Repeated use	Measure completed questions, skips, disabling, and return behavior with consent. Do not claim learning from completion counts alone.

Proposed repository layout

AGENTS.md
docs/brand_position.md · docs/style_guide.md
research/interviews/ · research/reddit_research/
personas/ · assets/logo/
openspec/ · src/ · tests/

Create the actual product repo after confirming its location and platform. The current workspace contains a different project; this report does not alter its setup.

Instructions for future coding agents

Copy-ready draft supplied in supporting files. Adapt to the class template and actual project before installing it.

Product and required context

Offer one reviewed SAT question at a chosen app-opening moment. Read docs/brand_position.md, docs/style_guide.md, relevant research, and the current feature specification before changing behavior.

Evidence discipline

Preserve interview IDs and exact quotations. Do not invent testimonials, score gains, persona facts, or device support. Keep ErrorJournal and tutoring findings separate from evidence for app-triggered practice.

Development workflow

Use OpenSpec after installation. Write the proposal, scenarios, design, and tasks. Resolve platform uncertainty, implement a small change, verify scenarios, and record remaining limits.

Product rules

Users choose apps and timing. Keep skip and pause visible; respect frequency settings. Avoid repeated-trigger loops. Never require a correct answer in the proposed default mode. Provide a safe exit on errors.

Content, design, and data

Use original or appropriately licensed, reviewed questions. Follow agreed style tokens. Support keyboard focus, readable contrast, and reduced motion. Minimize data collection; keep identities, raw notes, and secrets out of public builds.

Commands and verification

No application stack or commands are configured. Add actual install, development, build, and test commands after setup. Test eligibility, skip, pause, repeated opening, feedback, and error exit. Report only checks actually run.

Team handoff

Explain behavior changes and remaining limits in each pull request. Team members make final product and release decisions. The supporting AGENTS.md includes the expanded copy-ready version.

What is ready, what remains

This report is useful as a consolidated draft. Completion of the assignment requires the remaining work below.

Deliverable	Current status / remaining work
Synthesis comparison	AI synthesis and quote audit drafted from 12 accounts. Insert the team's independent Part A; review and own Part C.
Reddit research	Five linked threads and five selected excerpts. Complete the class-agent/manual 30-100-file corpus workflow or confirm an accepted alternative with the instructor.
Persona agents	Three editable prompts and clearly labeled simulations. Install, run, and save each agent's actual reaction; ages remain unknown.
Brand position	Research-grounded draft. Team must review the promise and proposed controls.
Style and logo	Five HTML directions, 12 rough vector marks in this report, and provisional logo exports. Obtain keep/kill feedback, refine finalists, and inspect the real page on a phone.
Repo setup	OpenSpec recommendation and draft AGENTS.md. Create the product repo, install the chosen workflow, add the documents, and record real run/test commands.
Submission	Assignment specifies files in a team folder and one pull request. PDF and supporting design files are not a substitute for that structure.
